Project 2 summary

Much of my first report still applies to this current report in terms of software used to recreate my first page with bootstrap. However, for clarity's sake I will restate those knowns in a condensed form as follows:

- HTML and CSS editor: Brackets
- SSH file uploader software: Cyberduck
- Tested on: Firefox, Google Chrome, and IOS safari

Additionally, in some difference to my first report, considerable thanks must be given to my classmates for posting links to their finished pages on the discussion board. Being able to see their before and after shots was quite helpful in understanding how bootstrap should function and its intended result. For exactness, the page for which this report was created, was made with the simple sidebar bootstrap template. This template was found on startbootstrap.com and is free to all. I wanted a template that was closer to the layout of Google Keep, which is a note taking app offered for free by Google. I settled on the sidebar template for several reasons that follow:

- The design was simple, but it leaves for me a lot of room to expand and create my own design from the excess space.
- In the near future, I plan on using that page as a sort of information hub for regions in the campaign setting of a game I play. These regions, denoted by name on the sidebar, will contain information of the people, weather, and creatures

found therein. So far, a form or modal for these bits of information seem the best to me; or at least a better alternative to making all of the entries a link to other sites, therefore requiring multiple tabs to be open in the same browser.

Perhaps the most time consuming part of this project was determining which template to use. From the many presented through your thoughtful links, I was inundated with potential candidates. Yet none fit the bill for the original, “note/ quick reference” type page I had in mind. I managed to change that vision to better fit the template I started with; leading to the, “information hub” that I hope this page to become.
